τ Data Samples

ALEPH:	$3.3 \cdot 10^5$	reconstructed τ decays	
BaBar / Belle:	$1.4 \cdot 10^9$	$\tau^+\tau^-$ pairs	
Belle-II:	$4.6 \cdot 10^{10}$	$\tau^+\tau^-$ pairs	
sτcF:	$2.1 \cdot 10^{10}$	$\tau^+\tau^-$ pairs	(10^8 near threshold)

Luminosity ($10^{35} \text{ cm}^{-2} \text{ s}^{-1}$) is important. Systematics also!

Advantages of the threshold región:

- Ability to measure backgrounds (running below threshold)
- Free of heavy quark backgrounds
- Single-Tagging  Precise measurement of absolute branching fractions
- Monochromatic spectra for two-body decays (π , K)

τ 's @ LHC

□ Excellent signature to probe New Physics

Difficult to identify light objects ($Z, W^\pm$) with only Jets

QCD Jets orders of magnitude larger

Must rely on leptons

□ LHC produces high-momenta τ 's

Tightly collimated decay products (mini-jet like)

Momentum reconstruction possible

□ Low multiplicity. Good tagging efficiency

□ Heaviest lepton coupling to the Higgs (4th H Br)

□ Polarization information
