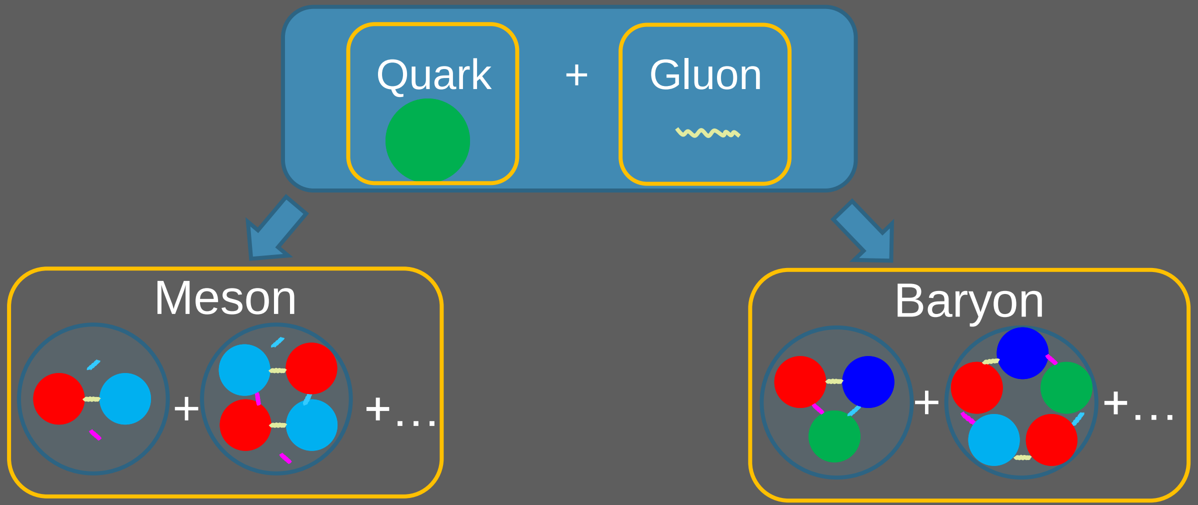
Outline

- ***Introduction***
- Chiral quark model with HLS
- $SU2$ ground states + excited states
- $SU3$ ground states
- Summary

Introduction

Hadron are made by quarks and gluons



The dynamics of quarks and gluons are described by Quantum chromodynamics (QCD)

- QCD have two important features:
  - Color confinement
  - Asymptotic freedom

- In low energy region the perturbative calculation for QCD is impossible, alternatively:
  - Lattice QCD (non-perturbative calculation)
  - Effective models (chiral perturbation theory, quark model, etc…)

Meson Summary Table

See also the table of suggested $q\overline{q}$ quark-model assignments in the Quark Model section.
• Indicates particles that appear in the preceding Meson Summary Table. We do not regard the other entries as being established.

LIGHT UNFLAVORED ($S = C = B = 0$)

Baryon Summary Table

This short table gives the name, the quantum numbers (where known), and the status of baryons in the Review. Only the baryons with 3- or 4-star status are included in the Baryon Summary Table. Due to insufficient data or uncertain interpretation, the other entries in the table are not established baryons. The names with masses are of baryons that decay strongly. The spin-parity J^P (when known) is given with each particle. For the strongly decaying particles, the J^P values are considered to be part of the names.

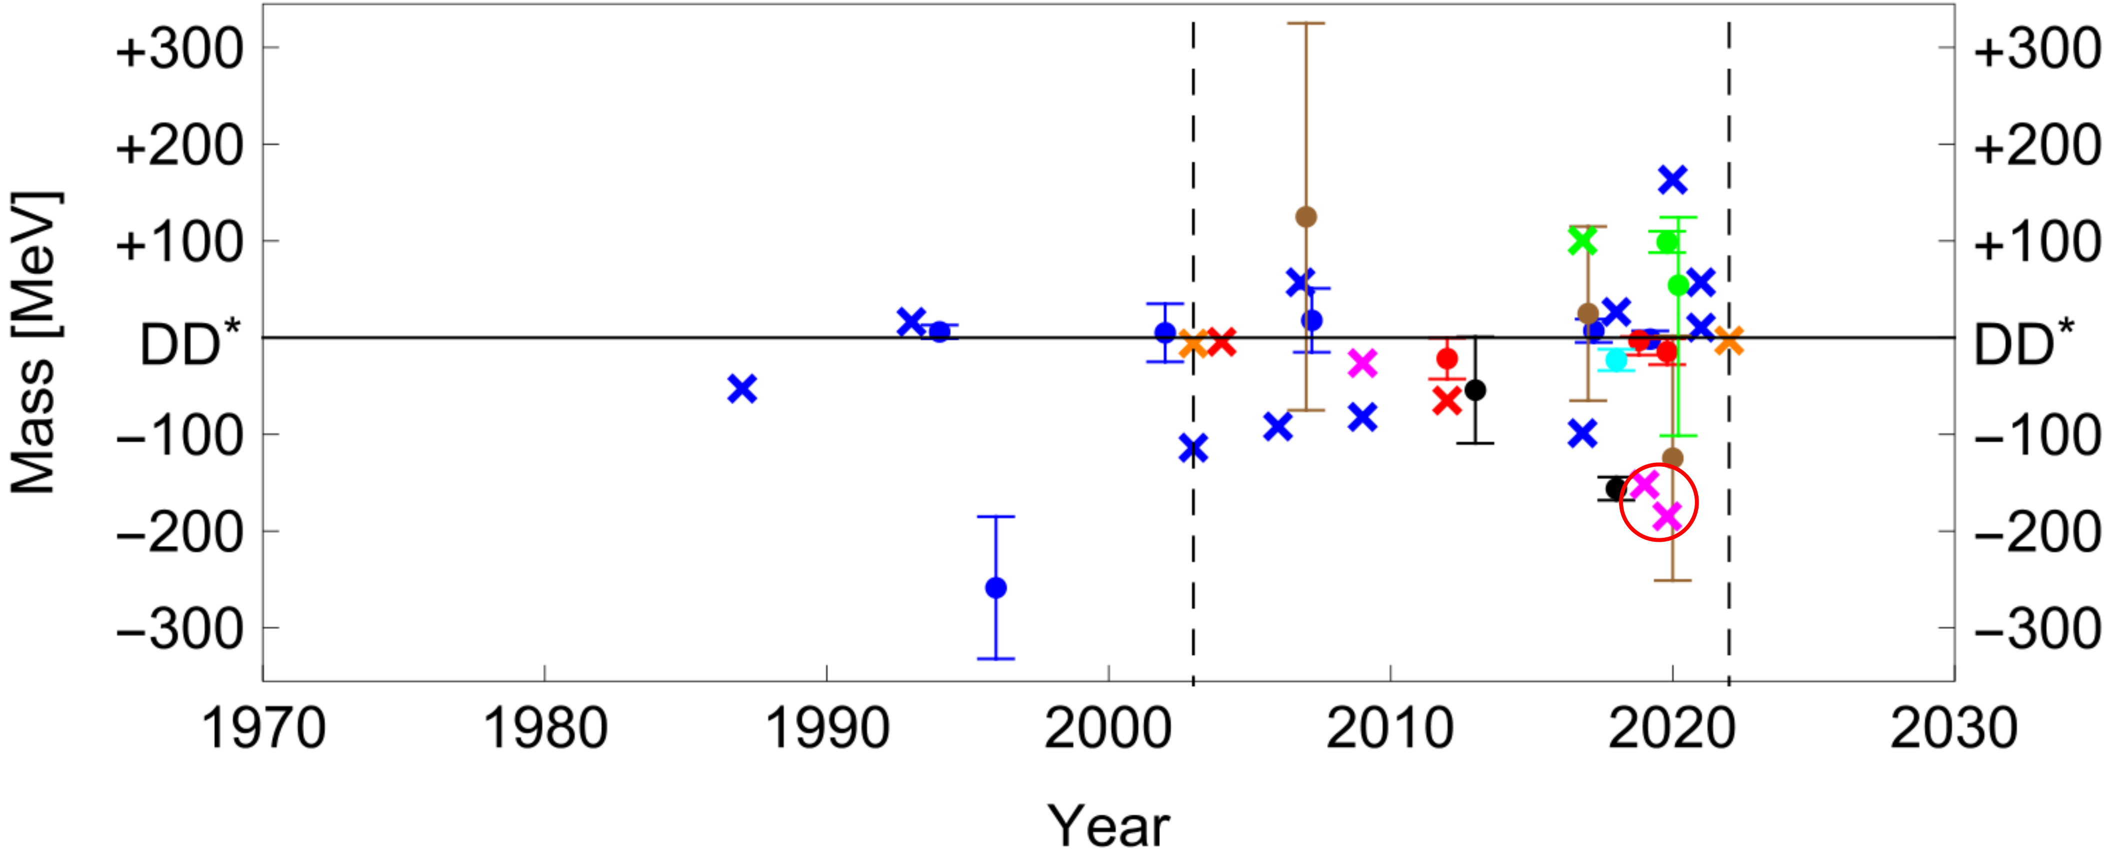

Figure 42. Theoretical predictions on the mass of the doubly charmed tetraquark state $cc\bar{u}\bar{d}$ with $(I)J^P = (0)1^+$, with uncertainties (error bars) and without uncertainties (crosses), calculated based on the compact tetraquark picture through various quark models [454, 500–515] (blue), QCD sum rules [462, 516, 517] (brown), heavy quark symmetry [467–469] (green), and others [461, 466] (black), as well as those calculated through the hadronic molecular picture [477, 479, 518–520] (red), the quark model considering the mixture of the meson-meson and diquark–antidiquark structures [481–483] (magenta), and lattice QCD [499] (cyan). The two dashed lines with orange crosses denote the $\chi_{c1}(3872)$ ($X(3872)$) first observed by Belle in 2003 [30] and the T_{cc}^+ recently observed by LHCb in 2021 [42, 43].

- H. X. Chen, W. Chen, X. Liu, Y. R. Liu and S. L. Zhu, Rept. Prog. Phys. 86, no.2, 026201 (2023)

Meson exchange in nuclear force:

- $\pi(138)$ **Long-ranged tensor force**
- $\sigma(500)$ **intermediate-ranged, attractive central force plus LS force**
- $\omega(782)$ **short-ranged, repulsive central force plus strong LS force**
- $\rho(770)$ **short-ranged tensor force, opposite to pion**

- R. Machleidt, Phys.Rev.C 63 (2001) 024001

Outline

- Introduction

- ***Chiral quark model with HLS***

- $SU2$ ground states + excited states

- $SU3$ ground states

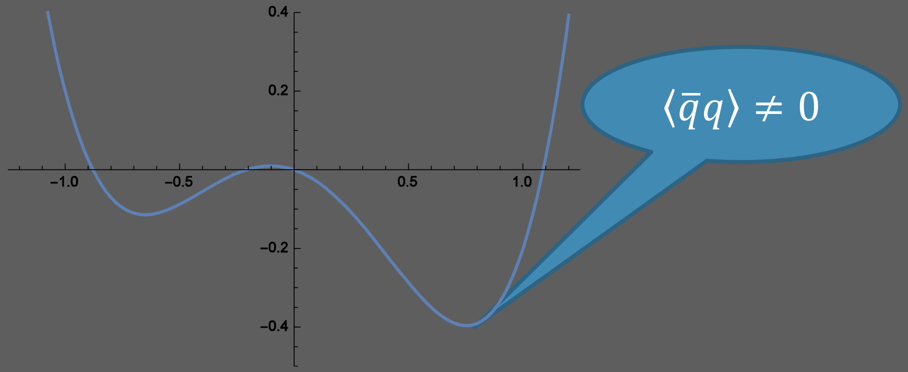
- Summary

The chiral symmetry

The chiral symmetry:

Spontaneously breaking of chiral symmetry:

$$\langle \bar{q}q \rangle = \langle \overline{q_L} q_R + \overline{q_R} q_L \rangle \neq 0$$

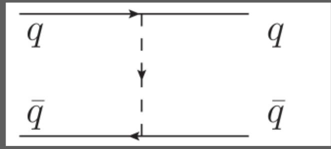


The effective theory based on chiral symmetry:

- Nonlinear sigma model
- Chiral perturbation theory

Chiral quark model

gluon exchange

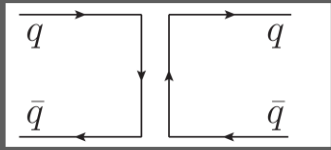


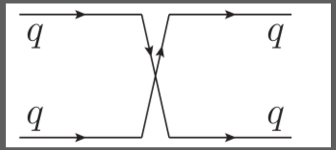
- Gell-Mann, M., 1964, Phys. Lett. 8, 214.
- Zweig, G., 1964, CERN Reports No. 8182/TH. 401 and No. 8419/TH. 412).
- N. Isgur, G. Karl, Phys.Lett.B 72 (1977) 109.

Naïve quark model:

- Quark mass term
- Kinetic term
- Color confinement potential (CON)
- One gluon exchange (OGE)

meson exchange





The Nambu–Goldstone boson exchange:

- Chiral symmetry is spontaneously broken
- Pseudoscalars (π, K, η) are the Nambu–Goldstone (NG) bosons of chiral symmetry breaking
- Scalar meson σ as the chiral partner of NG bosons

- K. Shimizu, Phys. Lett. B 148, 418-422 (1984)
- Z.Y. Zhang, Y.W. Yu, P.N. Shen, L.R. Dai, A. Faessler, U. Straub, Nucl. Phys. A 625 (1997) 59.
- J . Vijande, F . Fernandez, A . Valcarce, J. Phys. G 31, 481(2005)

Chiral quark model

pseudoscalar + vector meson exchange + CON

- Quark mass term
- Kinetic term
- Color confinement potential (CON)
- Pseudo-scalar + vector meson

- L. Y. Glozman and D. O. Riska, Phys. Rept. 268, 263-303 (1996).
- L. Y. Glozman, Nucl. Phys. A 663, 103-112 (2000).

Scalar + pseudoscalar + vector meson exchange + CON + OGE

- Quark mass term
- Kinetic term
- Color confinement potential (CON)
- One gluon exchange (OGE)
- Scalar + pseudoscalar + vector meson

- L. R. Dai, Z. Y. Zhang, Y. W. Yu and P. Wang, Nucl. Phys. A 727, 321-332 (2003).
- Bing-Ran He, Masayasu Harada, Bing-Song Zou 2306.03526, 2307.16280

Incorporate the vector meson contribution

The hidden local symmetry:

M. Bando, T. Kugo, K. Yamawaki. Phys.Rept. 164 (1988) 217-314
M. Harada, K. Yamawaki. Phys.Rept. 381 (2003) 1-233

$$
\begin{aligned}
U &= \xi_L^\dagger \xi_R = e^{2i\frac{\pi(x)}{f_\pi}} \\
\xi_{L,R} &\to h(x)\xi_{L,R} \cdot g_{L,R}^\dagger \\
\xi_{L,R} &= e^{i\frac{V(x)}{f_V}} e^{\mp i\frac{\pi(x)}{f_\pi}}
\end{aligned}
$$

$$h(x)^\dagger h(x) = 1$$

$$h(x) \in H_{\text{local}} \ , \quad g_{\text{L,R}} \in G_{\text{global}}$$

- The transformation for U do not changes, which seems that the freedom of vector meson is "hidden"

$$[SU(N_f)_L \times SU(N_f)_R]_{global} \times [SU(N_f)_V]_{local} \to [SU(N_f)_V]_{global}$$

- Hidden local symmetry is an extension of chiral perturbation theory

- Hidden local symmetry is a systematic way to include pseudo-scalar mesons (π, K, η, η') and vector mesons $(\rho, K^*, \omega, \phi)$

Outline

- Introduction
- Chiral quark model with HLS
- ***$SU2$ ground states + excited states***
- $SU3$ ground states
- Summary

The Hamiltonian

$$H = \sum_{i=1} \left(m_i + \frac{p_i^2}{2m_i} \right) - T_{CM} + \sum_{j>i=1} \left(V_{ij}^{\mathrm{CON}} \right.$$
$$\left. + V_{ij}^{\mathrm{OGE}} + V_{ij}^{\sigma} + V_{ij}^{\pi} + V_{ij}^{\omega} + V_{ij}^{\rho} \right)$$

Bing-Ran He, Masayasu Harada, Bing-Song Zou, 2306.03526

$$\begin{aligned} V_{ij}^{v} = \frac{\Lambda_v^2}{\Lambda_v^2 - m_v^2} \Bigg\{ & \frac{g_v^2}{4\pi} m_v \left[Y(m_v r) - \left(\frac{\Lambda_v}{m_v} \right) Y(\Lambda_v r) \right] \\ & + \frac{m_v^3}{m_i m_j} \left(\frac{g_v(2f_v + g_v)}{16\pi} + \frac{\boldsymbol{\sigma}_i \cdot \boldsymbol{\sigma}_j}{6} \frac{(f_v + g_v)^2}{4\pi} \right) \times \left[Y(m_v r) - \left(\frac{\Lambda_v}{m_v} \right)^3 Y(\Lambda_v r) \right] \\ & - \boldsymbol{S}_+ \cdot \boldsymbol{L} \frac{g_v(4f_v + 3g_v)}{8\pi} \frac{m_v^3}{m_i m_j} \times \left[G(m_v r) - \left(\frac{\Lambda_v}{m_v} \right)^3 G(\Lambda_v r) \right] \\ & - \boldsymbol{S}_{ij} \frac{(f_v + g_v)^2}{4\pi} \frac{m_v^3}{12 m_i m_j} \times \left[H(m_v r) - \left(\frac{\Lambda_v}{m_v} \right)^3 H(\Lambda_v r) \right] \Bigg\} \end{aligned}$$

Outline

- Introduction
- Chiral quark model with HLS
- $SU2$ ground states + excited states
- ***$SU3$ ground states***
- Summary

The Hamiltonian

$$H = \sum_{i=1} \left(m_i + \frac{p_i^2}{2m_i} \right) - T_{CM} + \sum_{j>i=1} \Big(V_{ij}^{\mathrm{CON}} + V_{ij}^{\mathrm{OGE}} + V_{ij}^{\bar{\sigma}} + V_{ij}^{\eta} + V_{ij}^{\eta'} + V_{ij}^{\pi} + V_{ij}^{K} + V_{ij}^{\omega} + V_{ij}^{\phi} + V_{ij}^{\rho} + V_{ij}^{K^*} \Big)$$

Bing-Ran He, Masayasu Harada, Bing-Song Zou, 2307.16280

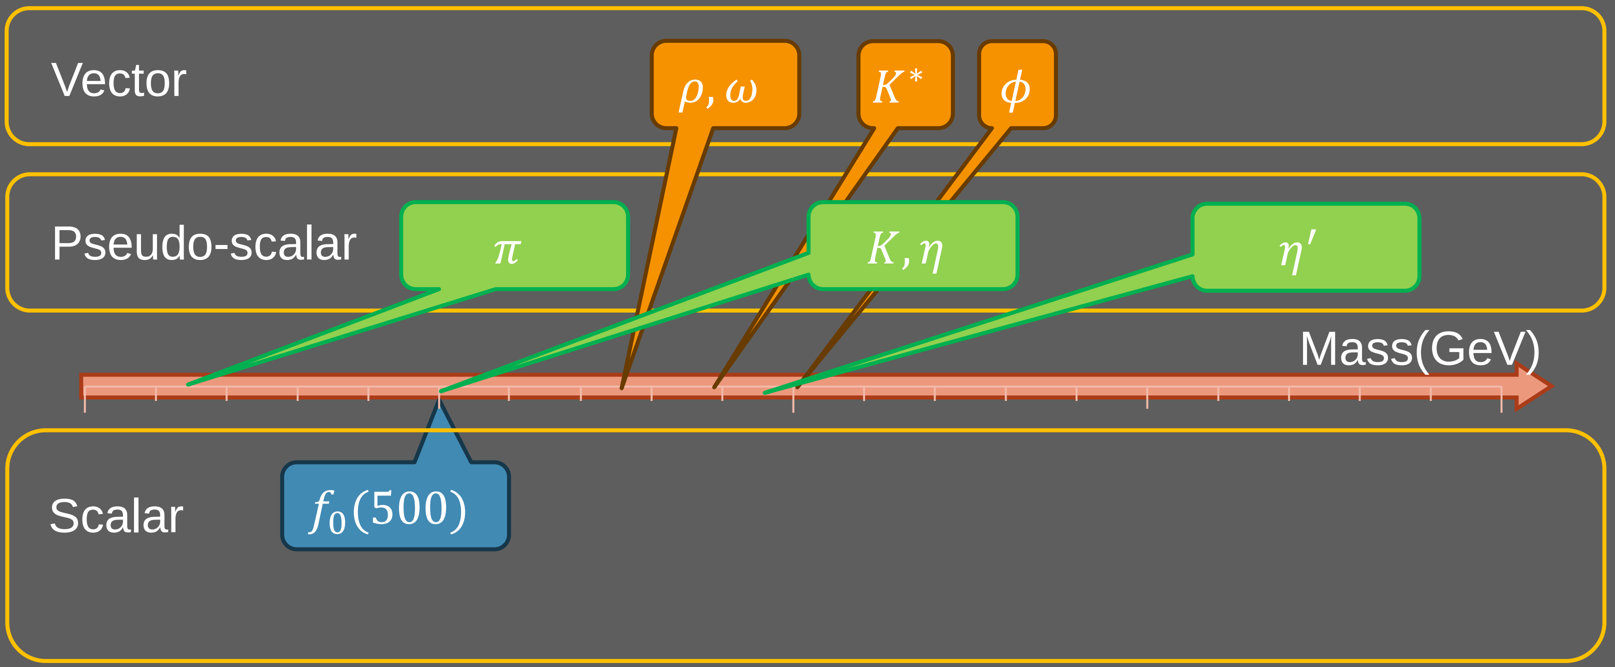
$$V_{ij}^{\bar{\sigma}} = V_{ij}^{s=\bar{\sigma}, g_s = g_{\bar{\sigma}q}} \lambda_i^q \lambda_j^q + V_{ij}^{s=\bar{\sigma}, g_s = g_{\bar{\sigma}s}} \lambda_i^s \lambda_j^s ,$$
$$V_{ij}^{\eta} = V_{ij}^{p=\eta, g_p = g_{\eta q}} \lambda_i^q \lambda_j^q + V_{ij}^{p=\eta, g_p = g_{\eta s}} \lambda_i^s \lambda_j^s ,$$
$$V_{ij}^{\eta'} = V_{ij}^{p=\eta', g_p = g_{\eta' q}} \lambda_i^q \lambda_j^q + V_{ij}^{p=\eta', g_p = g_{\eta' s}} \lambda_i^s \lambda_j^s ,$$
$$V_{ij}^{\pi} = V_{ij}^{p=\pi, g_p = g_\pi} \sum_{a=1}^{3} \lambda_i^a \lambda_j^a ,$$
$$V_{ij}^{K} = V_{ij}^{p=K, g_p = g_K} \sum_{a=4}^{7} \lambda_i^a \lambda_j^a ,$$
$$V_{ij}^{\omega} = V_{ij}^{v=\omega, g_v = g_{\omega q}} \lambda_i^q \lambda_j^q + V_{ij}^{v=\omega, g_v = g_{\omega s}} \lambda_i^s \lambda_j^s ,$$
$$V_{ij}^{\phi} = V_{ij}^{v=\phi, g_v = g_{\phi q}} \lambda_i^q \lambda_j^q + V_{ij}^{v=\phi, g_v = g_{\phi s}} \lambda_i^s \lambda_j^s ,$$
$$V_{ij}^{\rho} = V_{ij}^{v=\rho, g_v = g_\rho} \sum_{a=1}^{3} \lambda_i^a \lambda_j^a ,$$
$$V_{ij}^{K^*} = V_{ij}^{v=K^*, g_v = g_{K^*}} \sum_{a=4}^{7} \lambda_i^a \lambda_j^a$$

$$\lambda^q = \begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 0 \end{pmatrix}, \lambda^s = \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

The coupling have relations based on $SU3$ flavor symmetry:

$$g_{\eta s} = g_{\eta q} - \sqrt{3} \cos\theta_p g_\pi$$
$$g_{\eta' q} = -\cot\theta_p g_{\eta q} + \frac{1}{\sqrt{3}\sin\theta_p} g_\pi$$
$$g_{\eta' s} = -\cot\theta_p g_{\eta q} + \frac{\cos\theta_p \cot\theta_p - 2\sin\theta_p}{\sqrt{3}} g_\pi$$
$$g_\pi = g_K$$
$$g_{\omega s} = g_{\omega q} - g_\rho$$
$$g_{\phi q} = -\sqrt{\tfrac{1}{2}}(g_{\omega q} - g_\rho)$$
$$g_{\phi s} = -\sqrt{\tfrac{1}{2}}(g_{\omega q} + g_\rho)$$
$$g_\rho = g_{K^*}$$
$$f_{\omega s} = f_{\omega q} - f_\rho$$
$$f_{\phi q} = -\sqrt{\tfrac{1}{2}}(f_{\omega q} - f_\rho)$$
$$f_{\phi s} = -\sqrt{\tfrac{1}{2}}(f_{\omega q} + f_\rho)$$
$$f_\rho = f_{K^*}$$

The exchanged mesons in $SU3$ model



Symmetry of the model

Particles and Fields
Predicted mass spectrum of missing meson and baryons which have not been experimentally confirmed shown by orange line with 40 MeV error. The values of Ω_{bbb} shown here are shifted by −3000MeV.

Outline

- Introduction
- Chiral quark model with HLS
- $SU2$ ground states + excited states
- $SU3$ ground states
- ***Summary***

- Quark model with hidden local symmetry gives a systematic description from light meson/baryon to heavy meson/baryon

- Quark model with hidden local symmetry gives correct interaction between qq and $q\bar{q}$, thus its easy to extend the model to describe multiquark states, e.g., tetraquark, pentaquark, …

- Quark model with hidden local symmetry gives size messages and percentage of components, which could help us to identify the particles observed from experiments
