

Non-Hermitian RG Flows

Tuesday, 3 December 2024 14:50 (30)

We study holographic theories featuring a non-Hermitian inhomogeneous scalar deformation. We find phases where a purely imaginary current breaks PT-symmetry spontaneously. These PT-broken phases flow in the IR towards a pseudo-Hermitian conformal fixed point realizing PT-symmetry restoration at the end of the RG flow.

Presenter(s) : AREAN, Daniel (Instituto de Física Teórica. Universidad Autónoma de Madrid)
